

1. folder and file structure to be checked. (2points)

Remark: mention if the code is monolithic if files not present properly.

2. Working of the pipeline (3points)

- check if all the stages of images are shown

i) semantic segmentation ii) depth map using MiDaS iii) safe zone mask iv) final image

Remark: mention if any stage is missing

3. 4 test cases difficulty low -> high each of (5points)

a. first test case: (no unsafe zone)

testing for best placement and boundary conditions

Remark: if the image is at a much greater distance or/and exceeds the boundary of the image else fine.

Target = 400,600

My result = 0.0435

b. Second test case: (evaluate reasoning)

testing for reasoning

ex. Here our object to be delivered is fragile and valuable so it should be delivered on the grass considering soft landing and not much far from the target as it is valuable

Remark: If the object is delivered on the pavement or/and if very far from the target.

Target = 500,300

My result = 0.0983

c. third test case: (slightly harder evaluating the cnn model and rotated)
testing if the image can identify water, pavement and roof as all of them have same shades of color.

Remark: if the object is delivered on the road or in water then mention it

Target = 200,120

Result = 0.0077

d. fourth test case: (A new image with variations not from the dataset)

tests the generalization of the CNN model

Remark: Mention if the model is not able to generalize well as if it is not able to work on new images

Target = 400, 500

My result = 0.0508
